

**For a good internal air**

**Scandinavian people breathe the best air in Europe.**

Investigations show that the quality of breathing air in well air conditioned work places is better than in homes. The board used in the office furniture we market, veneered and lacquered with solvent-free UV-lacquer has been classified as the only furniture board to meet class M1 standards. Solid wood or veneered board lacquered with water thinnable UV-lacquer also causes remarkably less emissions than corresponding materials treated with solvent-based lacquers. Scandinavian people breathe even Europe's best indoor air.

For years we have tested emissions caused by materials in furniture. Nearly all materials used in our office furniture meet the strictest M1-class requirements for materials causing the least emissions. According to the measurements made by the Turku regional health care institute the indoor air quality in an office room with normal ventilation and with our office furniture comes up to the best classification value S1.

Research information and classification will help manufacturers to find better alternatives than before. We have all become sensitive to odours in different ways. In everyday life it's worth trusting in investigation and your own nose.
